Candidate Conservation Agreements (CCAs) allow the US Fish and Wildlife Service (FWS), the Bureau of Land Management (BLM), and the Center of Excellence (CEHMM) to work in cooperation and consultation with private land owners and industry in support of conservation measures for the Lesser Prairie-Chicken (*Tympanuchus pallidicinctus*) (LPC) and the Dunes Sagebrush Lizard (*Sceloporus arenicolus*) (DSL), which were warranted for listing under the Endangered Species Act of 1973, as amended (16 U.S.C. § 1531, et seq.). CCAs:

- Develop, coordinate, and implement conservation actions, which reduce and/or eliminate known threats to the LPC and DSL in New Mexico on federal, state, and private surface and minerals;
- Support ongoing efforts to re-establish and maintain viable populations of both species in currently occupied and suitable habitats;
- Encourage development and protection of suitable LPC and DSL habitat by giving Participating Cooperators incentives to implement specific conservation measures.

Under the CCA, federal lessees, operators, or permittees that join by voluntarily signing a Certificate of Participation (CP) receive a high degree of certainty that additional

restrictions would not be placed on their otherwise legal activities if either species is listed. The companion Candidate Conservation Agreement with Assurances (CCAA) provides incentives for voluntary conservation of species-at-risk on non-federal lands. Under the CCAA, the lessee, owner or permittee voluntarily commits to implement specific conservation measures on non-federal lands for the species by signing a Certificate of Inclusion (CI). Under the CCAA, if either species is listed, private landowners receive assurances

The Dunes Sagebrush Lizard is native to a small area of southeastern New Mexico and West Texas.

The Lesser Prairie-Chicken is native to parts of Colorado, Kansas, New Mexico, Oklahoma, and Texas.

that additional restrictions would not be placed on their otherwise legal activities. Without regulatory assurances, landowners may be unwilling to initiate conservation measures for these species. In both cases, signing up for the CCA or CCAA is voluntary.

CEHMM is the Federal permit holder for these agreements and is responsible for implementing, monitoring, and reporting on projects completed with CCA/A funds (Figure 1). CEHMM is a 501(c)(3) not-for-profit corporation based in Carlsbad, New Mexico. CEHMM's participation allows for a federally approved, independently audited financial management system to provide for fund management and administration.

The following monthly report details projects funded and completed with CCA/A funds as well as every day implementation of the agreements including activities such as moving wells out of DSL habitat. For more details on the CCA programs, visit our website at www.cehmm.org.

Benefits of Candidate Conservation Agreement Programs

- ⇒ Voluntary
- ⇒ Provides on-the-ground conservation
 - ⇒ Landscape based approach

- ⇒ Allows landowners and industry to continue work on the ground

Photo courtesy Grant Beauprez

- ⇒ Aims to prevent listing

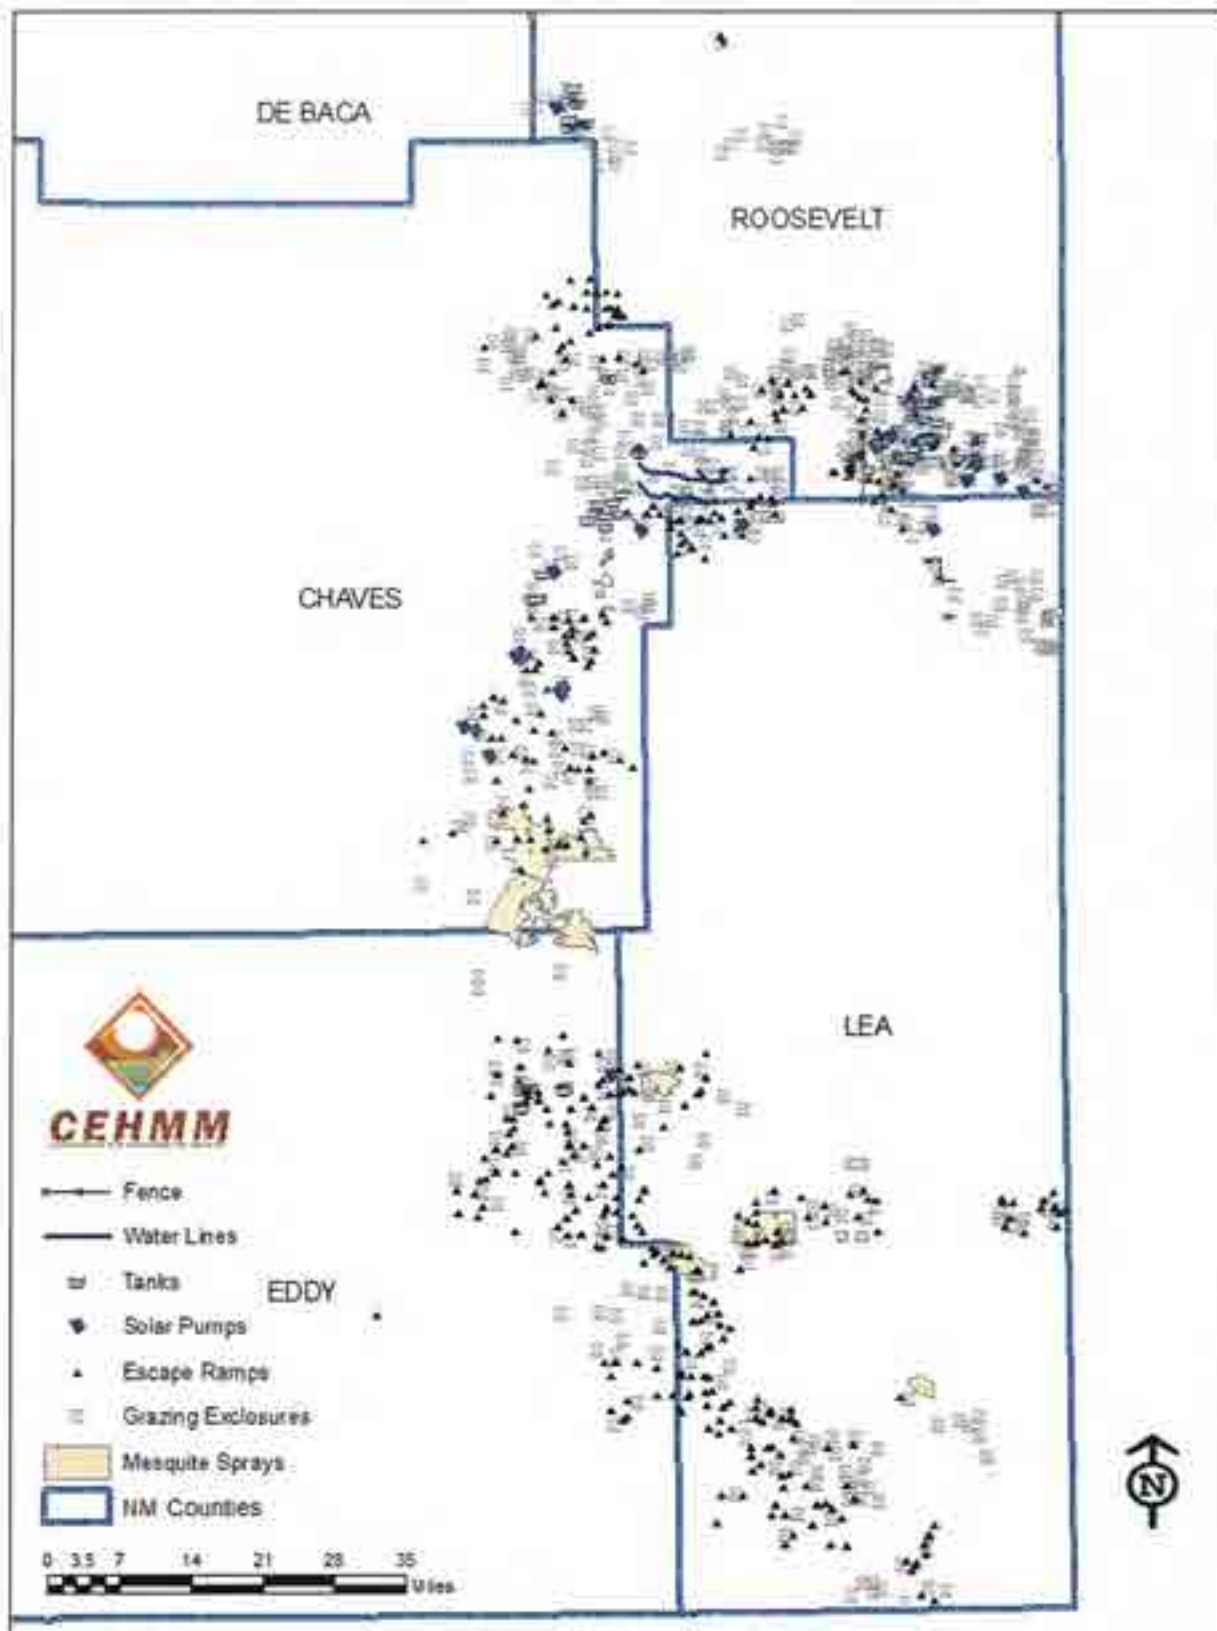

Figure 1: Map of all Completed Projects throughout Life of CCA/A Program

Conservation Activities and Monitoring

CCA/A – District 1 – South of Hwy 380

Whit Storey, former Range Conservation Scientist in District 1 has been promoted to Interim Project Manager.

CEHMM personnel conducted an onsite with an enrolled company and the BLM for a drill pad . The pad was located on acreage enrolled in the CCA. It was determined by the BLM and CEHMM that the pad would not impact DSL or LPC.

CEHMM received grazing management plans for one enrollment. The remaining four ranches have been contacted and they are currently working to finalize those plans.

CEHMM personnel conducted a total of 13 LPC surveys on nine enrolled ranches in District 1. LPC were heard on two ranches. Two previously known leks were located with six birds each, and one new lek was located hosting six LPC.

CCA/A – District 2 – North of Hwy 380

CEHMM personnel started LPC surveys in March 2018. As of April 25, 2018, 27 ranches and three roadsides have been surveyed with a total of 71 leks and a bird count of 892 (Figures 2 and 3).

Figure 2: Lesser Prairie-Chicken seen while out doing LPC surveys.

Conservation Activities and Monitoring

CCA/A – District 2 – North of Hwy 380

Figure 3: Lesser Prairie-Chicken flushed while out doing LPC surveys.

CEHMM personnel are working with enrollees to develop proposals, budgets, and maps for submission to the ranking team at the June 2018 meeting.

The vacant position for a field-tech in Milnesand has been filled by a soon-to-be Eastern New Mexico graduate with a Bachelor's of Science degree in Wildlife and Fisheries Biology. The new employee will start in May 2018.

Quarterly project monitoring has been completed for April 2018. Everything was in good working condition.

CCA/A – District 1 & District 2 Combined Efforts

A LPC/DSL Strategic Meeting was held on April 11, 2018 at the Milnesand Community Center. The meeting was held to prioritize conservation measures to determine which would be the most beneficial to the LPC and the DSL. The discussion led to prioritizing grazing, mesquite spray, and the removal of dead standing mesquite.

CEHMM personnel provided an update on the CCA/As to the Southeast New Mexico Public Lands Committee in April 2018.

Completed Projects April 2018

CCA/A – District 1 – South of Hwy 380

No projects were completed this month.

CCA/A – District 2 – North of Hwy 380

No projects were completed this month.

Funded Projects Awaiting Completion

CCA/A – District 1 – South of Hwy 380

Pearce Water – This project was funded in August 2014 for \$200,000. The Pearce water well (Figure 4) was drilled to a depth of 380 feet into a water bearing zone in a sandstone formation. A pump test was conducted, with the well maintaining a flow rate of one gallon per minute. Drilling mud was cleaned out of the well with no increase in the flow rate. CEHMM has contacted the drilling company contractor to discuss options for improving the quality of the well. An RFP was sent out and awarded to bail and pump test a well that has had a windmill removed and be converted to solar power. The pump test will occur in was scheduled for April 2018, but has been moved to May 2018. Once the pump test is complete CEHMM will move forward with the solar conversion of this well.

Smith Water – This project was funded in July 2016 for \$19,657.63. CEHMM will develop a bid proposal for contractors. National Environmental Policy Act (NEPA) was completed in August 2017. Mr. Smith is completing the road bore. Due to the potential installation of a rail spur near the original project location, this project will be modified to incorporate portable water stations. These stations will have the ability to be moved throughout the ranch. Modifications will be sent to the ranking team for their recommendations at the June 2018 meeting.

CCA/A – District 2 – North of Hwy 380

Riley Mesquite – This project was funded in February 2014 for \$98,707. CEHMM personnel determined that the insect damage was too severe on the honey mesquite to adequately absorb the herbicide; therefore, the project has been postponed until late summer of 2018 if conditions are favorable (Figure 5).

Funded Projects Awaiting Completion

CCA/A – District 2 – North of Hwy 380

Mesquite Hand Treatment of Active Leks #1 – Due to a significant disparity in bids received, a second RFP has been approved for the Mesquite Hand Treatment of Active Leks #1. CEHMM determined that the discrepancy warranted a rebid to remain fiscally responsible to the CCA/A program. Requests for bids have been sent out and published. Bid submittals are due by 4:00 pm on May 1, 2018. Seven 502-acre plots will be hand treated for Honey Mesquite to total 3,514 acres (Figure 5). This project was funded in March 2017 for \$897,876.85.

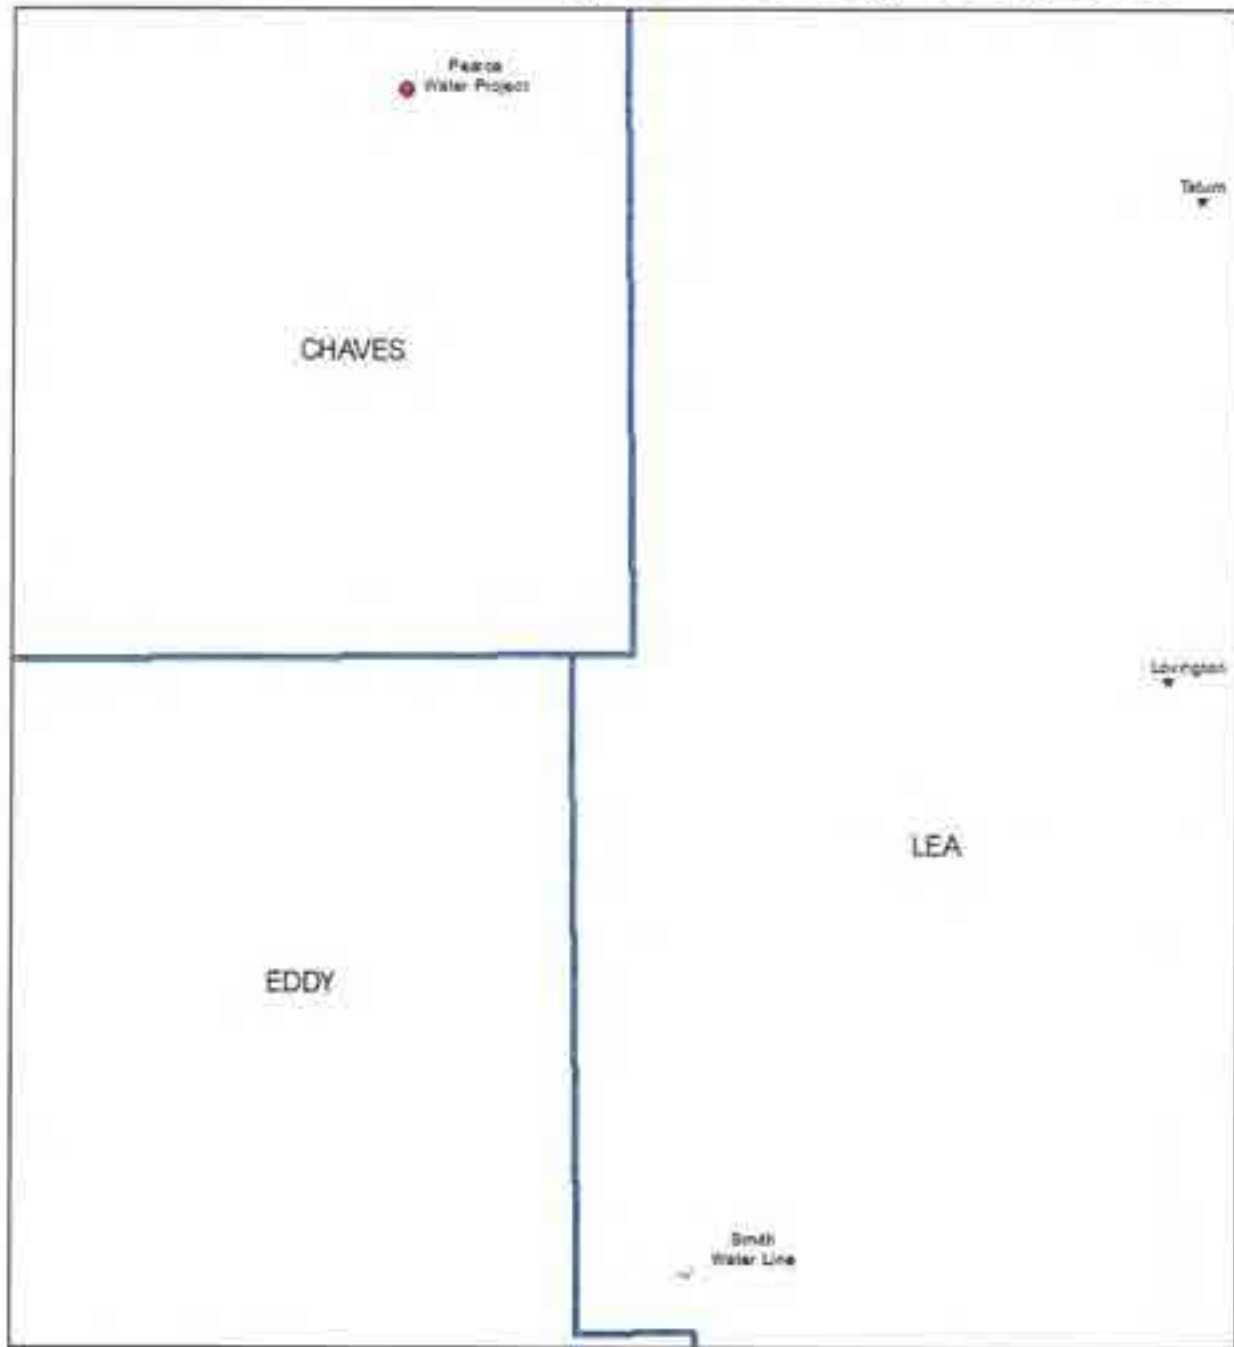

Mesquite Hand Treatment of Active Leks #2 – The ranking team has approved additional leks to be hand treated. This project was funded in August 2017 for \$745,470. CEHMM and the ranking team are in the process of identifying leks to be treated.

Bresenham Mesquite – The Bresenhams have decided not to submit a proposal for their mesquite treatment at this time, but may reapply at a later date. This 450 acre project (Figure 5) was funded in August 2014 for \$11,750.

Mesquite Eradication – In August 2017, the CCA/A ranking team approved proposals for removal of dead standing mesquite (DSM). One of the remaining two projects will be started in July 2018 with the other being started immediately after completion of the first. Both will be completed in 2018, following two years post treatment. Eradication will be completed via rotary cutter attachments for the purpose of removing vertical structure. Refer to attached “Conservation Benefit: Mesquite Removal” (Appendix B). All eradication efforts will be conducted on deeded lands.

- Peterson/Luman DSM Removal – 250 acres of DSM will be removed (Figure 5). This project was funded in August 2017 for \$26,562. Work will commence in 2018.
- M. Williamson DSM Removal – 482 acres of DSM will be removed (Figure 5). This project was funded in August 2017 for \$48,671. Work will commence in 2018.

Education

Audubon of New Mexico Education/Outreach Manager is initiating Audubon's plans for the CCA/A funded project "Engaging Community in Conservation Education". They are developing a high school environmental education program to be delivered to local students within historic and current Lesser Prairie-Chicken/Dunes Sagebrush Lizard habitat in New Mexico. This program will target the following New Mexico high schools: Dora, Floyd, Elida, Portales, and Carlsbad Early College High School with the intent to engage at least one class in each school by the end of the contract period. Audubon will provide a finished curriculum with lesson plans by June 2018.

Operations Moved out of DSL Habitat

Construction of well pads and roads for oil and gas development in DSL habitat poses a serious threat to a species which depends on a very specialized dynamic habitat. Due to the severity of the loss of DSL habitat from development, enrollees have agreed to conservation measures including no-surface occupancy within 30 meters of suitable or occupied DSL habitat. CEHMM attends onsite with enrolled companies to help site roads, pads, pipelines, and power lines in areas that are in near proximity to suitable and occupied habitat. During the onsite, CEHMM helps to determine suitability of the habitat and ensure that the companies avoid the dunes by the required 30-meter buffer. If the disturbance is within the 30-meter buffer, then the enrolled company, in order to comply with their agreements, must relocate the disturbance to occur outside of the 30-meter buffer. The number of wells and ROWs moved out of DSL habitat below shows the importance of every day implementation of the CCA/As to the conservation of the species.

Year	Federal Wells	State Wells	ROWs	Seismic Data Acquisition (Acres)
2009	0	0	0	2,900
2010	79	0	0	1,454
2011	83	0	15	0
2012	65	22	1	0
2013	73	3	7	0
2014	77	6	1	0
2015	36	37	68	0
2016	80	15	0	0
2017	5	0	0	0
2018	0	0	0	0
Total	498	83	92	4,354

Reclamation/Restoration

In areas of loose and sandy soil, oil and gas well pads and roads are constructed from caliche, which is a layer of calcium carbonate that is precipitated below the soil surface through evaporation in arid environments. Caliche makes an ideal substrate for roads; it becomes almost impenetrable when compacted with heavy equipment. When companies construct these roads and well pads in LPC and DSL habitat, this impenetrable layer fragments the habitat. Reclamation of these wells and pads removes the caliche from the surface using heavy equipment. By removing the caliche pads and roads, fragmentation in LPC and DSL habitat is reduced or eliminated. Once the caliche is removed, reseeding with native vegetation occurs which speeds up the process of rehabilitating the disturbed areas. The table below details the reclamation treated to date through the CCA/A agreements.

Total Acres Treated for Entire Project	
Roads and Pads Caliche Removal and Reseeding (Number)	154
Mesquite (Acres)	79,363
Dead Standing Mesquite Eradication (Acres)	1,922.7
Yucca (Acres)	120

Well/ROW/Frac Pond Deductions

Industry Participating Cooperators are assessed fees for surface disturbing activities, which CEHMM assesses on a monthly basis. New surface disturbances include, but are not limited to wells, Rights of Way (ROW), and frac ponds. The fees assessed are then deducted from the Participating Cooperator's CCA/A Habitat Conservation Fund at the end of each month. A copy of the deductions are sent to Participating Cooperators for verification. If a Participating Cooperator has a positive Habitat Conservation Fund balance, then the fees are deducted from that Participating Cooperator's Habitat Conservation Fund. If the company does not have a positive Habitat Conservation Fund balance, the company is issued an invoice for the amount of the remaining balance. The tables below show fees assessed for surface disturbing activities.

Total Deductions for April 2018
\$230,750.00

Total Deductions for 2018
\$896,250.00

Total Deductions for Entire Project
\$19,273,831.96

Conservation Benefits

Grazing Management

CEHMM recognizes the mutual benefit between sustainable grazing and lesser prairie-chickens. Collaboration between enrollees and the efforts of the CCAIA via technical and financial assistance leads to improved grassland health.

The lesser prairie-chicken (LPC) occupies four ecoregions in the Great Plains. In eastern New Mexico and west Texas, this region is known as "Sand Shinnery Oak Prairie" (SSOP) and is dominated by shinnery oak, sandbig-bluestem, little bluestem, sand drop seed and sand sagebrush. Ranching is the most common use of this large expanse of land. Grazing as a conservation tool for the LPC is an essential management component as this endemic species has evolved with large bovines for centuries. SSOP is the southernmost extension of the LPC range; the warmest and driest ecoregion of the four ecoregions. Sustainable grazing practices have been identified by Center of Excellence (CEHMM) and US Fish and Wildlife Service (FWS) as a top priority to insure adequate habitat for all life stages of the LPC.

CCAIA

Benefits of Sustainable Grazing

- Improved rangeland for wildlife and ranching operations.
- Improved quality and quantity of forage.
- Heterogenic landscapes for all grassland species.
- Drought resiliency.

Conservation Benefits: Grazing Management

Range Conservationist Spotlight

CEHMM District 2
Josh Ricklefs

Sustainable Grazing and the Lesser Prairie Chicken

"Grazing practices utilizing a rotation pattern, paired with stocking rates that the land is capable of supporting, promote habitat for the lesser prairie-chicken, while also allowing ranchers to sustain and improve rangeland health. Sustainable grazing practices leave residual vegetation of sufficient height and density that the lesser prairie-chicken can utilize for nesting, brood-rearing, and concealment from potential threats. This also helps the rancher by acting as a drought contingency plan, as the rangeland will be in better condition when a drought event occurs. The vegetation will also be more resilient and will be able to respond better once drought conditions end. Through vegetation monitoring, CEHMM can analyze trends along with current rainfall data to assist ranchers in planning for these events. Improved and new infrastructure via projects through CCA funding also allows the rancher to implement sustainable grazing practices to the benefit of both the rancher and the lesser prairie-chicken."

The dunes sagebrush lizard, a species of concern, is a secondary beneficiary of sustainable grazing. Attention to the treatment of their very specialized habitat and ability to survey on private lands has increased survey numbers and knowledge in this species.

Photo courtesy of Mike Hill

CCAIA

Sustainable grazing practices are addressed in the Candidate Conservation Agreements and Agreements with Assurances (CCA/CCAA). The voluntary Certificate of Participation (CP) and Certificate of Inclusion (CI), which applies to enrolled ranches on federal, state and/or deeded lands, partially includes:

- ✓ Improving or maintaining conservation lands.
- ✓ Designing grazing plans to meet habitat specific goals for individual ranches that may include stocking rates, rotation patterns, grazing intensity and duration, and contingency plans for varying prolonged weather patterns including drought.
- ✓ Utilizing no more than 45% of current year's forage growth.
- ✓ Consultation with CEHMM prior to using herbicide treatments on shinney oak due to impacts upon LPC and the dunes sagebrush lizard (DSL). Post-treatment grazing management is essential for success. Grazing by any livestock will be deferred during the growing season for at least the two consecutive years following treatment.

CEHMM works with enrollees on grazing plans, improving infrastructure and monitoring vegetation. CEHMM, with approval from the Candidate Conservation Ranking Team, offers assistance on such practices as brush management, water development, prescribed fire, fencing, and defragmentation through road and well pad reclamation.

CEHMM monitors vegetative components of LPC habitat on the enrolled livestock operations to determine habitat improvement, static levels, or decline in habitat by using standard protocol methods:

- ✓ Forage utilization cages.
- ✓ Determination of composition and cover of forbs, grasses and woody plants through established grazing monitoring methods.
- ✓ Establishing photo points to view trends.

Conservation Benefits: Grazing Management

Appendix B

Conservation Benefits

Mesquite Removal

Fragmentation and loss of habitat for the lesser prairie-chicken is considered a major cause for the decline in population of this grassland bird across their range.

Honey Mesquite (*Prosopis* spp.) is universally accepted as an invasive and highly competitive shrub that may readily encroach onto landscapes that did not historically support the species. This landscape has experienced intense disturbance or changes in natural ecological processes over a significant period of time. Through interspecific competition with other beneficial plant species, mesquite has increased in frequency, and subsequently led to a transition from grassland landscapes into shrub/grasslands which is less desirable for grassland birds, specifically lesser prairie-chickens (LPC). Research shows that LPC avoid areas with more than 1% mesquite canopy cover due to changes in vertical obstruction and conversion to shrub-dominated landscapes, which greatly limits desirable habitat for this species.

Mesquite outcompetes desirable grasses and forbs, thus reducing quality and quantity of nesting habitat for LPC. Removal or reduction of mesquite in lesser prairie-chicken habitat, followed with proper grazing management, can increase production and composition which will benefit grassland species.

Mesquite skeleton following a successful herbicide treatment.

CCA/A

Conservation Benefits: Mesquite Removal

LPC Biologist Highlight

Blake Graham, PhD, Texas Tech University

"Mesquite removal is most beneficial for lesser prairie-chickens in areas within 1-2 miles of existing, active leks. Contemporary evidence suggests mesquite encroachment in areas surrounding leks causes lesser prairie-chickens to constrain their space use to areas without mesquite. Also, and more importantly, mesquite dominated landscapes (~25% mesquite cover at any scale) are structurally different than grasslands, and research shows that lesser prairie-chickens select shrubs and grasses 15-25 inches tall for nesting and brood rearing activities. The benefits of mesquite removal for lesser prairie-chickens are maximized when the skeleton of treated plants are completely removed. Post-treatment care via managed grazing and prescribed fire is highly recommended to give beneficial grasses and forbs the competitive advantage over mesquite in treated areas over time. Beyond 1-2 miles of existing, active leks, targeting areas between active leks in sandy soils that contain mesquite is an excellent strategy to promote connectivity between active lek clusters across the sand dunnery oak ecoregion in New Mexico and Texas."

Conservation Benefits:

- ✓ Improved grasslands habitat for lesser prairie-chickens.
- ✓ Increase grasslands resiliency for drought conditions.
- ✓ Removes vertical obstruction.

CCAIA

CEHMM's Approach to Mesquite Control

- Aerial herbicide
- Hand application of herbicide

Aerial application is the least expensive method to control mesquite because large areas with high densities can be treated. The ability to perform aerial applications is limited by plant health, precipitation, temperature and wind speed. Certain thresholds within these limitations must be met to ensure that the treatment will be successful.

Hand application may be performed at any time of the year. This method produces a higher percent kill of individual plants due to the ability of directly applying the chemical to each plant. Cost per acre is appreciably higher than aerial applications and smaller areas with lower densities must be targeted.

CEHMM's Approach to Removal of Dead Standing Mesquite

- Shredding-Mowing

Once the mesquite plant is dead, the skeleton of the plant is still a vertical obstruction and must be removed to actually deliver a conservation benefit for the LPC. CEHMM returns to past herbicide treatments and removes the dead standing mesquite.
